Épigénèse du cerveau, de la mémoire et de l'intelligence (French Edition) Georges Lepetit, Dr Patrick Lepetit

Une nouvelle représentation graphique de la croissance du périmètre crânien appliquée aux mesures faites sur 500 enfants français met en évidence la période de croissance rapide du cerveau qui se termine vers un an en moyenne. Plus de 1 000 tests de Q.I. ont été pratiqués sur 300 des enfants de la même population ; cette étude psychologique de 3 à 11 ans, dont les résultats n'ont pas été publiés à l'époque, est unique en France . La comparaison des Q.I. et des périmètres crâniens montre que ce n'est pas le volume du crâne qui est en rapport avec le Q.I. mais la vitesse de croissance au cours de la première année ($r = 0,80$). La croissance rapide du périmètre crânien est la conséquence mesurable de la synaptogenèse et de l'extension du cortex cérébral, substrat de la capacité globale de mémoire. Ce phénomène spécifique étonne par sa précocité. Il apparaît également que l'évolution du volume endocrânien du genre Homo est devenue négative pour les Européens depuis 20 000 ans et, d'autre part, que la croissance du cerveau des nouveau-nés prématurés est plus rapide que celle des nouveau-nés à terme durant la même période.
